Global Solutions 0:02

You haven't slept, man.

Kelvin Kibiru Peter 0:05

But this is what you do.

Global Solutions 0:11

I've decreased some of that behavior.

Kelvin Kibiru Peter 0:15

These days I'm not working through the whole night. But you can message me at any hour and I can respond, which is...

Global Solutions 0:24

It just means no one's ways on.

Kelvin Kibiru Peter 0:30

Actually, I texted you in the morning and then I saw one critic. thought you weren't up. No, no. I had an alarm.

Global Solutions 0:42

I had an alarm.

Kelvin Kibiru Peter 0:45

But I made sure to sleep. That's what I made sure to do yesterday. I made sure to sleep. Okay. Yes, what about Steve? Hello, Steve. Hi, hi guys. Hi, Stephen.

Stephen Nyansoho 1:03

Hi, Ron. Are you good?

Kelvin Kibiru Peter 1:06

I'm good, Stephen.

Stephen Nyansoho 1:07

You sound tired. No, no, no, no. He's not tired.

Kelvin Kibiru Peter 1:12

I slept very late also.

Stephen Nyansoho 1:17

Yeah. It will be worth it.

Kelvin Kibiru Peter 1:22

Yeah.

Stephen Nyansoho 1:23

It's okay.

Kelvin Kibiru Peter 1:27

All right. I guess we'll just jump into it. This meeting is to check the progress of what you've been doing, how far we are, and also get to get some things clear now that you have, like I said, when we have something that we can see, it's easier to see the problems and the changes rather than just discussing something that doesn't exist. Yeah.

Global Solutions 1:55

Yeah.

Kelvin Kibiru Peter 1:55

So just wanted to check the progress, what you have, and also... Get clarification so that by that, that is, in the next few days, we're able to have all the changes that we need. So I think we're going to, I'm going to, Steve, I don't know if you're ready, I want to present at least what we have, what I have. So, and very fast, we'll make it quick. Steve, there of explaining every bit, take it a bit faster, but also, at least we make sure we tackle every part. Also, I expect Steve to have some questions that needs clarification. I also have some by the end of the session, so at least we can see. So first, we just start with the progress of where we are. I think, I think we are, we are in track as, as far as the time. So what you have to do is just check on what needs to be changed, or what needs improvement. I don't know. don't know. Can you see my screen? Yeah, can see it perfectly. Yeah, yeah, yeah.

Stephen Nyansoho 3:27

Okay.

Kelvin Kibiru Peter 3:28

I'm just going to do a quick presentation of what we have, what I have, and then we can have questions, clarifications, then make the remaining changes that needs to be made. So for Sweet One Live, I have the front end. I've been working lately on the back end. So I can say the project is... Confidently 80%, at least 80% complete, and what is complete is mostly what is the most critical. The few remaining things can be done within a day or two, of course provided that you get all the details that you need. But I just show, present what I have, and this is the main page. I did listen to your videos, on your, the report on the videos. It's okay. We just need, you can just use this one video, I think there are two, but a landscape. Yeah. And because we cannot work with the portrait, because the portrait will stretch extremely. won't, it won't be good.

Global Solutions 4:51

I've stressed this to the videographer, Namila, as we see this video for it, that's specifically the Chingford venue.

Stephen Nyansoho 4:58

Of course, nothing exists in the church.

Global Solutions 5:02

So the recommendation I made to them is, of course, as soon as they're operating in Shadowheath, to capture a similar video that matches exactly Sweet One Live.

Stephen Nyansoho 5:13

But for now, it's okay.

Global Solutions 5:16

It fits the idea of the aesthetic that I had in mind.

Kelvin Kibiru Peter 5:23

Okay. Let's do this. I'll present everything that is here.

Stephen Nyansoho 5:31

And then everything I have.

Kelvin Kiburu Peter 5:35

And then I'll give you a chance or an opportunity to ask questions, clarifications. And then after that, I'll also ask questions and clarification that I need. I have a few. That's cool. Yeah. So starting with the homepage, you said you wanted a storytelling on the first main page. So I took one of the videos that was in landscape. I think I only had two. This was what I found to be the best.

Global Solutions 5:58

So...

Kelvin Kiburu Peter 5:59

So... Of course, the landing page has the storytelling video, and then we have these sections. Now, these sections are not updated, just the text, but it just takes probably a few hours to be done. Because I also, one of the things that I'll require is about, we're talking about the menu and some of things that they have. So if we get this, then it will be easy to change this text. If you don't get that, then it's okay, you just have to adapt to the food, general text, we don't need the actual text, but if you get the menu items, the better, so that these texts can be updated. So this is a main landing page. There is a dark and light theme, so I just present it like that. Okay. The site is supposed to have multiple call to actions, CTS sections, and you'll find quite many. The images we received were very good, very good quality. So I believe you have these as well. You have a link. Yeah, yeah, yeah. So that is the main landing page. The main aim of the landing page is to give the impression and to give more details on what the place feels like, what we have in the place. Then you have the menu. If there's many pages you need, I'll need to update it to now what are the main items that we have. If we won't have them, then please. just have to add the images without the text, but if we get them, then this menu page is supposed to explain what is there, the drinks, the food, and

Kelvin Kiburu Peter (continued) 5:59

mostly all that, the drinks and the food. So I'll need some clarification and I'll ask some questions on the food ordering and how that will need to be done. And then we have events. The events that they'll be having, they can just update them on the system and then when they update them, they'll appear here. This top event, this first landing page will show the top event and you can see here, written top event, top event, they can put these on the system.

Global Solutions 9:00

When they add events, they can add, they can mark an event as a top event.

Kelvin Kibiru Peter 9:06

When they mark the event as a top event, it will take this main landing page. So this main landing page is dynamic. So when a new event is added and then it's marked as a top event, it will appear at the first event here. Consequently, the other events will appear below. And I did copy a design that you told me about his website. It's Solmama. So we have these events. So the way they look on the right and the left in this box shape. So you said that you wanted to adapt that. So I did adapt the same. So we have text and then we have the image of the event. We have text and then we have the image. We have the text name, the event. So these are all dynamic events. They added in the system, which means when you delete them, when you delete them, then They are moved from this page. So all of these events are events which are in the database and every new event that appears, the text will appear on one side, the image on the other, as this. Also, I have integrated Stripe for events, for booking tickets, although I'm still working on finalizing the ticketing system to make sure that it's very efficient. But I did add Stripe, I did integrate it. So let me, from the events, you can see, let's say this event. Now these are just demo images, because I don't have the actual event images. This is the name of the event, we have the information, we have the date, and we have the price. The

Kelvin Kibiru Peter (continued) 9:06

same for every event, we have the event name, we have the date, we have the date. We have the price. So if it's about booking a ticket, they can say the price. If there's a price, if it's a free event, they can say that. So it can be free or it can be paid for. But on every event, there's a book ticket button. So you can book ticket. When you book ticket, it will take you to this. It's a detailed page.

Global Solutions 11:22

It's a full image, but this is just a demo image. It should have the image of it.

Kelvin Kibiru Peter 11:28

This is a detailed page. It has more details on the specific event for this event. And then there's a booking form for the ticket. So let's say the name is Kelvin. The email is kelvin at gmail.com. And then I can select maybe the number of people that needs to attend. It's me or I want one or two tickets. And then I can pay. There's a pay button here, pay with card. So when I click pay with card, it should take me to checkout and check out using Stripe. So there's a, there's a Stripe dashboard for checkout. So before we email your code, we'd like to confirm your number. This is automatically, this is from Stripe. So I'd love to enter my number here for confirmation. And then, I don't want to really do that. So it has a currency conversion. This is 70 pounds. So it then it converts to Kenyan shillings. But this is a 161. So if you click pay without link.

Global Solutions 12:54

Pay without link. Yeah.

Kelvin Kibiru Peter 12:57

This is Stripe. The dashboard, so you can, it has Apple Pay, it has also, it has Apple Pay, this account doesn't have Google Pay, but you can enter your card details here and then pay. I will not do that because I'm using the live video, it will deduct the amount if I do that. But that is already integrated. So there's something you told me about how this needs to work. So it's already, the whole payment gateway is integrated, but I need to make sure that it's working perfectly.

Global Solutions 13:30

So that is not complete.

Kelvin Kibiru Peter 13:31

need to, a payment system needs to be very careful that it does not deduct people's money and then maybe it doesn't really end up processing the transaction. So let me say I have to carefully look at it and examine it before I can say it's actually, it's actually done. Yeah, but, but in terms of integration, then that's... That is done. So that was event. Then you have venues, venues, venues, venues. I need some clarification later, but let me just for now, I just want to present. So these venues will have the venue pages for booking or hiring the spaces. So maybe they can, these will need some clarification and ask later. These can, they can post if they have the available spaces. And then from then on, you say that it's an easy, it's an inquiry based. So then there's an inquiry button here. this is an inquiry form. So you can write your name, email, because I want to be fast. I'll not do that. But when you read the, your name, email, the event type, the estimated guests, the preferred date, and any additional details. Then you submit. When you submit that, all of these things are wired. So when you submit that, you will go to the dashboard. And then finally, you have the contact page, not finally, but we have this contact page. The contact page is when someone wants to send a message. So again, the full name, I think it's some brief details here, the subject test. And then

Kelvin Kibiru Peter (continued) 13:31

you can send the message also. Now this message will get to, for now it's set to go to the message sent. It's not to go to the dashboard, but it can also be set to go to the email. That is not a problem. That's just something very easy to be set to go to. So that's what I have on the frontend. And everything, I don't know, everything that is on the frontend is also wired on the backend. So if it's the contact messages that are shared, they are also wired to the dashboard. So in the dashboard, taking a moment to load up, but when it's doing that, we have the dashboard page, which shows a summary of everything. For example, it shows today, if there's some reservations, we have the number of tickets that have been sold. If any, it shows a high inquiries. It shows paid orders, if any. It shows some activities. You have an activity log here or other. An audit log for the system. So for main activities like orders, for activities like deleting data and some login sessions, when someone does such things, it will trigger the system to track that action. So for here, you can see there's a message I sent 57 seconds ago. That's where this was. Hello message I sent. This is a ticket order. Five minutes ago, I was testing some of these things. So that's why they're here. And this just shows some data. For example, we have seven spaces in the database. have seven, six events. We have state

Kelvin Kibiru Peter (continued) 13:31

ticketing types. This just shows every data we have in the system. We have the reservations page. The second page is reservations. Now reservations are for the... Actually, I didn't go to the center. Home page. This is the reservation. If someone wants to reserve a table, it's a reservation page.

Global Solutions 18:04

So there's a reservation form.

Kelvin Kibiru Peter 18:06

You can fill name, email, number of size of people that you expect, date, and their variable time. When you confirm this reservation, this is fully wired. It's fully wired to the backend. So when you do that, it will go to this dashboard. So in the dashboard, we have this inquiries page. Inquiries page is for, we have inquiry forms. We have several inquiry forms within the website. We also have the contact page that I just sent a message. When you send a message, you'll come here. So for example, here I can see there's a hello message that I just sent. And then I can see the details of that. So if anyone sends a message or an inquiry, then I'm able to see. We have a guest page here, which shows the number of The number of guests mostly are people who, like I was asking this question. I'm not sure we've covered it fully about account creation. If someone creates an account because we wanted to create accounts to generate leads and to follow up on people who are on the system.

Global Solutions 19:21

So that's why we have a guest page. This is to store information.

Kelvin Kibiru Peter 19:25

For example, here we have some information. So the person who filled the contact form, the details that that person filled, then when a person fills a contact form, we capture their details. Because I remember you said you want us to capture as much details as possible about people who visit the website. So when someone fills any form, when someone makes a reservation, we do capture the details. And you do see them here. So we can then use that follow up because you have recent, already set, recent sends emails. So for every form that a person fills in the system, There will be an email section. So from that, we can capture the email, and then we can send emails, confirmation emails, or follow-up emails as well. Several other pages. Let me see. Reservations. So the reservations page is for reservations. When someone makes a reservation, we can see all of these pages are now wired. Last time, I did not have them wired. was working on them, but all of them are fully set. So this reservations page, it shows current reservations, pending reservations, and canceled reservations, and we have the detailed reservations. So add the details of the reservation. So from the click here, you can see all the details of this reservation. This is something we just made from the front end.

Global Solutions 20:54

And then from there, have, that's the enquiries page. I've already talked about it.

Kelvin Kibiru Peter 20:59

300 and and it We have the events page, and now this events page, the work of it is to help the admin add events. They can add new events, they can delete an existing event that is loading. Let me go to the menu. You have the menu page. The menu page will have the menu items. Then the admin can add items from the menu that we see on the front end, those can be added by the admin. or they can also delete. This is a finance page because of the payment system. This finance page needs to be very critical integrated. So for now, it tracks the payments from Stripe, from the Stripe that we're making. So for now, I can see I have one unfinished checkout of 70 pounds. That is what I was trying to So to be So here I can see I have an unfinished order inventory of 70 pounds. Here I have refunded, if any amount, and that's why this is, I would say this is 90% done, so I'll still take more time on it. So this finance page shows the amount of funds that have been paid today, maybe for tickets or for events. That's for events tickets. It shows the total collections, it shows the ticket sales, and every information about the ticketing system and all the payments made on the system. It will be on this page. You have filters like the number of days, have number of months, pending or paid or refunded, we have tickets, collections. So all of these, they are wired to the system and you can also

Kelvin Kibiru Peter (continued) 20:59

see that. I have added this data visualization using Chart.js. So for this we can be able to see the amount of payments that have been made visually to visualize that data and also below we have the details of every transaction. you can see the one we are trying to take here then you can see the details. You have the reference, every transaction will get a reference code that's the customer, the email, the ticket type, the amount, it's pending, and everything that was that was happening for that system.

Global Solutions 23:40

The status is pending. have expired.

Kelvin Kibiru Peter 23:42

These are expired. I was trying those testing stripes. That's why they are expired because I do not complete them. That is the finance page. We have the menus page.

Global Solutions 23:55

The menus page shows menus, menu items.

Kelvin Kibiru Peter 23:59

We can apply So a new menu item, it will ask you for the name, the category, the name, the order, the price, the description, ingredients, nutritive value. These are optional. But you can add them. If it's a drink, if it's any menu item, you can add it. You can add an image here. It all wired up. You can add items. You can delete items from the menu. I have a button here, which can hide an item. So if I click on this button, it hides an item from, it hides this item from the public page. I can still have it on the dashboard, but if I want to split on the public page, I can hide it or I can show it. I can also edit and I can also delete these menus. I have some settings of the menu, including for now, just have the adding categories. For easy filtering, we do need to add categories to this menu. to the If you If drinks, if it food. So when you add these categories, you can, you can delete these categories. You can edit them. You can, and then when you, when you're going to add a new item and add a new dish, then the categories will show here. So these categories are fetched from the system so that it's easy to filter these menu items by categories. The other page, the dashboard, think I've, setting, I will, let me talk about the settings page. This is a very important page, settings page. This settings page for now has the audit trail. We can be able to track what has been

Kelvin Kiburu Peter (continued) 23:59

happening. I'll also add payments on the, so that payments are also audited. But for here, currently what you have auditing is for login. Who logged in at what time? So here for logins, you can see for now I have two emails. So for testing info switch one and my personal email. So these has. Settings, also, the password, this was a password update, this was staff login. So this audit record keeps track of what is happening in the system. Roles and permissions. This is the same as Steve had shown last time for the system, for his system.

Global Solutions 26:16

For roles, I can add a new role.

Kelvin Kiburu Peter 26:18

I have a super admin role, but I can add a new role, and I can give it a name, like manager. So this is when they want to issue other people roles. If it's a manager, can write the name, and then these are permissions. I can select the permissions I want, for example, if I want them to view reservations, view events, so that we do not need the admin to be able to, we don't need a developer to be able to adjust these things. So I can give a role, and then I can set that, or I can assign that role, I can create a role, and then I can assign emails to this role, so I can assign people this role, so that that these people people can. You into the system, but they'll have limited access, and the access will be limited to what I give them, what access I give them, and then the audit trail, each staff accounts, it shows all the existing accounts. For now, you just have two accounts which are allowed to log in into the system. I think I've explained every single page. We have my profile page. He just shows the profile. Also, you can change the password. I have integrated full password authentication. So, for this login, I was integrating password authentication and reset. So, now the data we're using here is directly from the database. So, this is the email and the login, but I can also reset the password. So, if I want to reset the password, I can reset the password. This is to make

Kelvin Kiburu Peter (continued) 26:18

it easy if someone forgets. can see, for Actually, Peter Kelvin. This is very important, so I wanted to show it. This is the final thing I'm actually showcasing before. I'll give you a chance to ask questions, and then I'll have some questions if you can get a notification. So, to reset the password, just enter the email, and then you send a link. If this email exists in the system, then it will send a link for resetting the password. But if this email does not exist in the system, then it will give you a notification of that email account that does not exist. So that email account that I just used already exists. So you can see, I got a reset password email on my screen and then on my Gmail. then, like you said, you said these emails we were using, for instance, are custom-based, as in they have the customer design. So you can see. Uh-huh. I don't think you can see. Let me, let me, let me adjust my, let me share my screen. So this is my email. So these were the email I got from Sweet1. It's custom branded for Sweet1. So it has Sweet1 logo and Sweet1 details. And then I have a reset password link. So when I click on this reset password link, then it takes me to a password reset page. I can set the password to reset. Of course, I enforce a password, um, checking so that the password must be eight characters, uppercase, and it's not easy password. Then I can save password. So

Kelvin Kiburu Peter (continued) 26:18

this just, it's very easy to reset the password. And then I've reset it and then I can log in now, actually. Uh, I can. So this page that I've logged into is not the superadmin account, so you can see the navigation on the side panel has very few links because this is not the, it's not a superadmin, this is just a role I created, so it has very few things over there. So I don't know, that's pretty much it, that's pretty much it, that's been what I've been working on, and for the logic part that is more than 80%, so what is, what is remaining is just minor adjustments and working on them, hardening the security system and the payment system, making sure the site is more responsive and that. So, yeah, what do you think so far, you can tell me, if it makes sense, if we...

Global Solutions 30:55

That makes sense, it makes, I think aesthetically it's making a lot of sense. I like the feature of the light and dark. I'm probably more a fan of dark because I probably spend a lot of time on computers that like everything dark. So aesthetically, from my perspective, it's looking good.

Kelvin Kiburu Peter 31:14

It's looking good.

Global Solutions 31:16

I have a couple of questions that probably cleared up for your explanation, but I just want to double confirm and then I'll gather what it is you need from me so I can take any further questions to sweep on themselves and gain some clarification. So just on the events that we're able to to set. In fact, did you show me the events dashboard? Yes.

Kelvin Kibiru Peter 31:44

Did I show you? Let me see. Events. Yes, I did show you the events dashboard. So I just wanted to know on the events dashboard, we can change the photos as per the event.

Global Solutions 31:58

I think you confirmed that, didn't you? Yeah, this is, you can see my screen, right?

Kelvin Kibiru Peter 32:03

Yeah, can see it. Yeah, this is the events page. Actually, as a matter of fact, don't think I didn't show this page. It shows the events, currently events, number of tickets booked, tickets remaining on sale, and sold tickets. And then there's a search bar here that shows you can filter upcoming events, past events, or all events. And then we have, then we have the all events. So for every event here, we have these are just some simple events.

ACTION ITEM: Add event thumbnail selection; update event detail to use selected image

Global Solutions 32:40

I just saw there, it said, add an image, zero to four. So if I was to add four images, how am I able to decide against the most significant thumbnail? Or is it just randomly allocated?

Kelvin Kibiru Peter 32:55

Okay, yeah, I did, I did allow adding multiple images, because for now, maybe for the, this for the event. So when you click on the event, then on the detail page, you can get more images above the event. I did not set a specific image as a thumbnail, but it's okay. I will set that. You can just mark a certain image as the main thumbnail image, and then it will just show. For this case, it's only the first image you're showing as the image. So we can set a custom marker for the thumbnail. No problem. Then moving on to the menu.

Global Solutions 33:34

In terms of the menu details, there's quite a few things I think we can do. Of course, we've got the menus that are already on the current website that you can see that exist. And for now, you can stick and assume that that's going to be the menu for Suite 1 Lab because they haven't given me the variation yet.

ACTION ITEM: Export PopMenu items via screenshots + Claude; share JSON w/ Kelvin for menu import

Kelvin Kibiru Peter 33:59

you. Thank Thank you. The other thing we can do is actually export the menu straight from PopMenu.

Global Solutions 34:06

Now, know there's no tool that actually just says export PopMenu, but what we can do is you can screenshot a photo of every single item on the PopMenu. Then we can use Claude to tell it to create whether it's a JSON file or whatever format of a file you want that information in, but it can extract and do that so that you can just integrate that straight into the centralized system that you have for these websites. Okay. How does that sound?

Kelvin Kibiru Peter 34:44

That's okay, that's okay.

Global Solutions 34:46

Yeah. And then regarding the photos, what I will say with the websites, of course you're not going to have a photo of every single item. But the photos that go on there will be like the most attractive. And so I guess the ones that go on the website, So what we need is that clarification over their names. So I think the first photo I saw on the website was the blue drink. That blue drink is called Blue Lagoon. And I think that's where we'll need input from Sweet One in terms of, well, is it Blue Lagoon you want on there? If it is Blue Lagoon, what do you want said about it? And then even is Blue Lagoon the first item that you want? Because Blue Lagoon is a drink. Maybe they want a dish first and then Blue Lagoon after. So that's, yeah, that's what I would say in regards to photos that go onto the website, of course not going to be every single photo, but the photos that go on there need to be, need to fit the aesthetic. I think the photos that I said I'm going to take through this week, I'm more thinking about the QR code app, because that app, every single item needs a photo. The whole point behind having that QR code app is that a customer doesn't know what the, doesn't know what the dish looks like.

Kelvin Kibiru Peter 35:57

So they have the app where they can use it.

Global Solutions 36:00

They can view it and they can see it, and do a lot more. Okay.

Kelvin Kibiru Peter 36:07

Any questions? Yes, I do have several questions. So the questions I had, they are more of the technicality part of how things are supposed to work. Number one is, how are orders for this system? I have, on the menu page, we are supposed to show these menus, but how are orders supposed to be handled? Are we supposed to allow people to submit orders for these items? These are public sites, which means anyone can access it anywhere. Yeah. How are we going to handle, should the system accept orders, in short, and if so? So then how would we handle that, food for the menu here? The key thing, the menu is for information purposes.

Global Solutions 37:09

That's the first thing on the website. It's just so people can see what is on the menu. In terms of what people can do in regards to ordering, with Street Wild Live currently, and I'll look through my notes, but off the top of my head, I remember, they want to be able to order for collection, not order for delivery, not pre-ordering so that when somebody comes into the restaurant, orders have already been accepted. Similar to what they have in Lewisham and Chingford, where somebody can place an order currently on the website, but it's purely for collection. Okay, okay. Now that collection feature that they currently have, remember, it runs through Toast. It's the Toast integration that they have, where somebody's placing an order for collection, and eventually the Toast, eventually the Toast, And I think that takes us back to what we were speaking about yesterday. Okay, okay.

Kelvin Kibiru Peter 38:11

So these online orders for collection, so payment is done before, right? Yeah, the payment is done before and currently even through Toast, yeah.

Global Solutions 38:25

Okay, okay, okay.

Kelvin Kibiru Peter 38:26

I mean, okay, that's okay, there's no problem. Just a question. Why are we using Toast? Why can't we use Stripe for these online? Online payment? Because Toast is the, Toast is the POS system that runs inside the restaurant. So they just want anything that comes, anything in regards to paying for food, they just want it as a singular system. Not to have someone Stripe, then someone Toast.

Global Solutions 38:53

But Toast is that, when somebody's in the restaurant and they're paying with card, or whether they're paying with cash, Toast... Toast is the system that picks up what's being paid for, when it's being paid for, and so forth.

Kelvin Kibiru Peter 39:08

Okay, okay. Toast is also the system that when somebody places a order, the waiters put through that information on Toast. Okay, another question about bookings, about these bookings for places, these booking places. I know we talked a bit about it for a bit. They have halls or they just book the place itself for them. What is being booked exactly? it, do they have rooms, halls that you can book for parties for such things or do? Do you book the whole place? How does the booking event happen? Say that again, please. My question is, the booking system, the booking for these places, if I want to book a place, or if I want to book this place, for example, here I have the venues, because this was something that we had agreed to do, and you say that it's actually supposed to be an inquiry based. Okay, you said that?

Global Solutions 40:33

Yeah, yeah. Yeah, my question is, what is, do they have rooms, or halls, or what is being booked, or do you book the whole place? So for venue booking, it's the whole place. For venue booking, it's the whole place that they would be booking. So we don't have specific rooms, halls?

Kelvin Kibiru Peter 40:56

No, no, no rooms, halls. I guess it's also...

Global Solutions 41:01

I guess it's also a question to ask the sweet one as to whether they want it to be used for very custom, because I saw the word corporate, but I guess the thing is, we're not talking about venue hire, they're talking about the whole venue. So whether it's corporate, whether it's a nighttime event, yeah, whether it's a booking or nighttime event, this is, it's just a booking inquiry regarding the whole venue, as opposed to a very specific room or table. Okay.

Kelvin Kibiru Peter 41:39

Can people make these payments for bookings online? Should people be able to do that? No, has to start, it has to start with an inquiry.

Global Solutions 41:53

I think for ease, for ease of transition, If on the sweet one side, it might even be a thing where they start with inquiry, and then definitely if they agree and make a deal with a customer, then they can send an internal strap link to the customer to complete the payment. Okay, this is an idea, but we can just discuss about it.

Kelvin Kiburu Peter 42:20

The way I was asking is because, of course, it's inquiry based. This is inquiry form I have here. So it just enter details, and then what you're looking for, and then you send. And you send, that goes to the system. You can also write to go to the specific email that they give. So it will go to both the system. Because you have an inquiry speech, it will also go directly to the email. Whichever email that you will make you, they will be attached here. Yeah. This is extra, but I was thinking if from the system, we can be able to send. And, uh... Follow-up emails. For example, if you made an inquiry and then it's approved, and then when it's approved, then on the same inquiry's dashboard, they can send an email to you. Your inquiry was approved. His information, this and this, this and this. And also, they can send you a payment link using Stripe. You can create a system, a custom payment link. when the system can generate a payment link, they just enter the amount and any details, and then that link can be sent by the email. When they send that link by email, when you click on it, because you already have Stripe wired, it leads you to Stripe, and then you can make the payment.

Global Solutions 43:49

And then the system will track that payment as paid, pending or not paid.

Kelvin Kiburu Peter 43:54

It's something extra, but it's not really. You can just give me your thoughts on it. Cool. Yeah. Apart from that, there's a reservation page for tables. Someone should be able to reserve a table. Is that right? Say that again? Yeah, the reservation page, because I also have a question about it.

Global Solutions 44:32

Of course, having spots a sweet one, they do want to stick to the seven rooms widget.

Kelvin Kiburu Peter 44:43

But for me, what I like, the seven rooms widget, you know what it does?

Global Solutions 44:47

It looks funny. This just looks neat. It fits the aesthetic. I don't know if there's a way in which this design remains, but the information still goes through the widget. Because I don't know if you've seen the current website. So when look at the widget, to me, it just looks like something that's chunked there, just put in place. Of course, what we will do and what we can do on the dashboard is the information from server rooms.

Kelvin Kiburu Peter 45:16

I've already put in a request for them to share an API that allows us to track and obtain the data.

Global Solutions 45:23

And even if anything, put the whole system in our very custom UI. So I put in that request on Saturday. I'm just waiting for them to get back to us. Okay.

Kelvin Kibiru Peter 45:38

So when someone reserves a table or something of that, then should that person be able to, you can just reserve a table, do you need to make any payments or? Yeah, they'll need to make a payment. They'll need to make a holding payment.

Global Solutions 45:53

The exact amount has gone out of my head, but they would make a... .. They a holding payment that doesn't exactly charge the card. It charges the card if they don't show up.

Kelvin Kibiru Peter 46:07

Oh, so that was what you were talking to me about.

Global Solutions 46:11

Yeah, that's the setting that they currently have on Serenium. Somebody will make a reservation. The card isn't charged. If they turn up, it's fine, no problem.

Kelvin Kibiru Peter 46:21

It's not added on to their bill, deducted from their bill.

Global Solutions 46:24

But if they don't turn up, then that payment charges the card. Got it, got it now.

Kelvin Kibiru Peter 46:30

Yeah, I needed that clarification. So for the amount, I think I will do that. Let me see that. And then for the amount, you can just make the amount custom so that they can add the amount from the system. They can just adjust it to whichever number. No problem. For booking tables, that should be custom. For booking tables. Well, when somebody makes a reservation, that is what they're doing.

Global Solutions 47:09

They're booking a table. Yeah, yeah.

Kelvin Kibiru Peter 47:14

That's a reservation, yeah. Yeah, that's a reservation, yeah. So, just let me get this clear. We are using server rooms in this system just for... Server rooms is the reservation and table booking system they can't use. What is it? It books their tables and reservation.

Global Solutions 47:40

Reservation is booking a table. That's what they can't use. Somebody wants to make a reservation in the restaurant.

Kelvin Kibiru Peter 47:45

That's what they use. So they wanted to integrate server rooms into this page? Exactly. Oh. Seven rooms has a simple widget.

Global Solutions 47:59

It's a widget that's... It's added on. Of course, they have scope for more integrations. So on Saturday, I put a message in the group chat showing you exactly what I've asked them for, because the other APIs and other smart things that you might want to do that give you custom control over what you can integrate, they ask you to make a bespoke request. I put that request in. I did that on Saturday. And so I'm just waiting for a response. Okay, okay.

Kelvin Kibiru Peter 48:33

Well, I do not, I don't have any other questions. Do you have any other questions? I mean, when we were looking at the dashboard, it had the word RIMS. And I guess the RIMS, yeah, there was a part where you're talking about, I saw, I can't remember where I saw the RIMS.

Global Solutions 48:58

this... Oh.filon's,

Kelvin Kibiru Peter 49:00

Let's say on inquiries or guests, was it guests? No, wasn't guests.

Global Solutions 49:12

Maybe it was, was it on finances? Anyway, I wanted to clarify the fact that the word room, currently, are you interpreting that the place doesn't have rooms, they have tables.

Kelvin Kibiru Peter 49:29

So I just wanted to make sure that.

Global Solutions 49:31

Yeah, I got that, I got that.

Kelvin Kibiru Peter 49:35

There should be no rooms in the system. So if that, if you saw that, then it's just a typo. I'll just fix it. I know, I understand. There should be no, there should be no rooms. No problem.

Global Solutions 49:48

The account creation to generate leads into source leads will be interesting. I'll make a point to sweep one before we meet on the third, but definitely on the third, I want to speak. Because for me, it's a very simple way to collect leads, to generate more information. I mean, the fact that the account shows you when somebody was last seen, we could expand onto that over time. When was the last time they came to the restaurant and so forth? There's a lot we can do there. There's a lot we can do there. I mean, even something that comes to mind is quite creative. If somebody is using the email, somehow you can see from the way in which they interact with the website and QR code app, you're able to identify somebody's favorite mail, but they haven't come for a long time. Maybe send them a special offer regarding their favorite mail. Do you get what I mean? Yeah, yeah. Yeah, but that's something to think about long term. Anyways, on the recent emails, you're talking about sending follow-up on confirmation emails, and I just wanted to confirm if they will have a very specific brand aesthetic. not just the generic email that i would send to my friend but when sweet1 send emails out it looks in this very specific way yes and i guess i did i did show you in these emails you can see this email yeah yeah these are the email the reset password email that i got so you can see it's custom

Global Solutions (continued) 49:48

you can we can make it as these are html templates we can make them as custom as possible these has the yes yeah you can see this page it has their logo yeah yeah it has a just a thing we can make it a custom nice nice nice nice nice that's fine um and then yes oh yes there was the unfinished order that came up in the system which i thought was great because we can see somebody's begun to check out um but i guess it was a question i asked you yesterday can they then be an automated So reminder to get the customer over the line. Oh, we've seen you started your checkout. Did something happen? Click here to finish off your order, kind of thing.

Kelvin Kibiru Peter 52:09

Of course, of course, very possible. We can do that. There's no problem. All right. Those are my questions though.

Global Solutions 52:17

Yeah.

Kelvin Kiburu Peter 52:20

A clarification on recent. You see, need you to know that these, I need you to know that I'm actually using Global Solutions API key. Yeah.

Global Solutions 52:32

To test these emails. Because what happens with the recent, you have to add a domain to the recent dashboard to be able to send emails to any email.

Kelvin Kiburu Peter 52:44

Yeah. Otherwise, it will only send emails to the account which you created the recent account on. Go ahead. That email. If you don't add a domain, then you can't send emails to avoid spamming people. You can't. Yeah. Because... Because Global Solutions, already have a domain that we bought, jsdeck.com, then I added that to Resend, so that I can be able to test these emails with multiple, I can send the emails to any account, so this is my personal account, so I can send the email. So now what needs to be changed is just the domains, the DNS records, and that is what I was having a problem with, because when I tried to change the DNS, I gave Steve the same API key, is for testing purposes only, because you what you have to do is very easy, just change the API key for this system, just change the API key. Now for this API key, I'm using the API key from Global Solutions. Now because when I tried to add domain to these on the actual browser, it asked for a code, so I did add some, but I did not add all of them, so maybe sometime later we can talk when I can add the rest to it. The confirmation code is being sent to, I think, I think that that's a phone number. I'm not sure. Say that again, sorry. The confirmation code is being sent to a certain, I think that's a phone number or something. Yeah. Yeah. So for me to add the DNS records, I would need that confirmation code. So maybe

Kelvin Kiburu Peter (continued) 52:44

you can plan the time I can get. I did add some, but I did not add a lot of them. So I still cannot use it. So you look for some time we can add, we can add all the DNS and then I can get them, I can get the activation code from the number that is being sent that code. Yeah. For now, this is Global Solutions API key. Yeah. I think, I think, I think, I think I'll just leave it at that. Then I invite Steve to see the progress. I am traveling today. mean, I'm currently staying in the city, but I'm traveling today and I'm hoping I'll see Steve so that at least we can see what we can improve for tonight. So I want to give him the opportunity to carry on with what he has. No problem. Okay.

Stephen Nyansoho 55:31

Thank you, Mr. Peter. Thank you. So let me just move on and try to present to what I've been working on. Yes. uh is my window visible yes okay thank you uh now on the website side side yeah this is what i've been able to come up with so i will just start uh from scratch before we go to the home page when the new clients hit the website uh you talked about uh uh cookies management something of that sort yeah yeah and uh yeah because uh this site will allow meta ads and google ads so uh the we supposed to ask if the customer the client is comfortable or not with us cookies so that's why you see this this this

Global Solutions 57:00

So if you accept, that means you accepted those permissions for, I think, Google Ads and MetaAds, things like that, and other cookies.

Stephen Nyansoho 57:11

So I will just accept that. And this banner is for upcoming event. So if there's any event to that hotel, so before you log in, it just notify you that there was an upcoming event this day and this time. So if you really want to explore, you can explore more. And if not, just later, something of that sort. And now this is the homepage. Yeah. So I'm using placeholders and also I've been using the old database for easy testing. So I've not, but not yet switched to the SuiteOne Superbase database.

Global Solutions 57:54

So you'll just understand that. So this is the homepage.

Stephen Nyansoho 57:58

Yes. On the homepage, you can book a table. This is a reservation, and also you can see the menu, and both are working, something of that sort. This is the homepage, actually, and it's very responsive, actually, when it comes to fonts. Yeah, so I'm using some, I'm using some placeholder images. I've not yet added the real images still. Yeah, something of that sort. Yeah, so this is the location, as you remember, this location I added earlier in my database, so I'm using the tested, so I'm not yet still switched to the Nini database, which is a few works, something of that sort. And then we have the footer here. And then we have the menu page. Now the menu page is just highlighting everything that you have in the, yeah, for Suite 1. what you'll offer everything and you can see the navigation everything yeah so yeah the menu like like the more you add items the more they appear the more you add the more they appear and also you can filter them like you can just you can use a filter depending on the main categories that are there or items so something of that sort and here we have some options you can book a table also from here or you can order for collection something that you are you're saying about yeah so maybe let me just go direct there for order for collection so i i i'm assuming i'm assuming that um i'm assuming that uh a client can come and like i miss a qr code on the

Stephen Nyansoho (continued) 57:58

table so it's that and he cannot he or she can access the website so is there a way that uh a client can access that qr so Or is there a way that a client who is confused and have access to website and is maybe in the hotel be able to have some instruction on how to make an order? So in the order for collection, we have two options. I'm here now. This explains if the client is currently in the restaurant and there's maybe some missing information. So if you click that, it tells you there is a QR code on the table. Maybe you can scan it. But also for phone views, this QR code scan automatically and pops the menu and you can just continue the normal flow. And if you are not there currently and you want to order for collection, something of that sort, you can just come here. And give this some information about which branch you want to order. And if you choose the branch, it takes you directly to the menu, what you want to order something like, like, let's say you have ordered this, you can just place, you can just continue, you select the time for which time you will collect that order, maybe something of that sort. And also you give the name of collection, maybe this one, and also the, the number maybe which will be reachable for anything. Yeah. So, and then you just place the order. So the order at the collection, I'm assuming that because I, because I didn't integrate any

Stephen Nyansoho (continued) 57:58

payment method, so I'm assuming that this person is going to pay as he collect his order, something of that sort. Yeah. And this order actually goes to the backend, to the, to the super admin. Maybe let me just log in so that you can see. Yes, let me just log in so that you can see. It's just normal order, something of that sort. If I come to orders here, the current orders, you can see I have that order right now, pending this one. And if you wait, it is indicated a collection. not like that other orders from the table. This indicates collection at 10. And also indicates the person and the number, something of that sort. You can avoid order, like just normal orders. Yes. And then that is menu we were talking about. And also we have order. Now order is just the same thing that I've been explaining all the way. We have our story. This I copied from the, I take the data from the older, the suite one older website that they were using. Yeah, something of that sort. So this is our story. This explains everything about suite one. Yes. And then, and then we have events. We have events. Uh, I think people explained to me that events, the events that we have here really differs from, uh, the suite one life. So maybe you will just clarify there, but let me just present so that you can see. So the events, uh, uh, The events, they are added in the back-end, like from the admin dashboard

Stephen Nyansoho (continued) 57:58

or the manager, let me assume that, so that if you come here, maybe in the events, you just come and see, so you can add new event, you can view this, actually it gives you a link to, to direct link to that event, something of that sort. Also, you can just add a new event, you can edit this, or you can hide this, yeah, assuming that, yeah, so on the adding new event, we have the picture of that, you choose the picture that will appear, you give the web address, and the tagline, and the description, the start dates, entry fee, maybe, you choose if it's going to happen, maybe in one branch, which branch is the event going to happen, something of that sort, and we just create the event, then, aha, that is it. We have locations. This explains the location of two different branches. I'm using the local database, the local database with the old information still. So that's why you're seeing this. So this explains everything about locations. And I think I will add images, maybe odd videos. Yeah. So that you suggest from you. And then we have the other page, which will be the last one. The contact. This one gives the contact where to get, where to get the sweet one, tea and something of that sort. Yeah. Give both, the both, for both branches. This branch, Lewisham and Chingford, something of that sort. Yeah. And then the last thing I'm going to talk about here is the booking, book

Stephen Nyansoho (continued) 57:58

a table. This is a book, like you're just booking for. Yes, so booking for reservation, you can book a table here. We have two options. Tell us when, so you can book a table or you can just private hire. So if you book a table, you can just choose the restaurant which you are going to book that reservation. It can be any branch. So these branches are here because of the old database. You choose the date. You give the name, email, and phone, something of that sort. You choose, you may give the occasion or something. If you can choose the occasion, it can be a birthday or something else. And also you can, anything, you can just provide some information for, yeah, for necessary. Sorry. And then I want you to check here on this checkbox.

Global Solutions 1:06:54

So I was reading from

Stephen Nyansoho 1:07:00

Some ethics in UK, so I saw that for marketing emails, those clients that do not want those emails, they are not supposed to be sent. So this checkbox allow clients to, like, allow the suite one to know which clients actually need this marketing emails, something of that sort. And after that, you can just send the request. And then if you send this request, it will come here because we have the reservations. So you can just come here and view it, the recent reservation. Let me just open it. So I made a certain reservation, so something of that sort, so you can come. see here so uh immediately immediately a customer filled this form and submit the request uh it sends him an email to to to to update him that you have really you have make a certain reservation to suite one hotel so waiting for we just wait for confirmation so immediately immediately uh uh immediately uh immediately the super admin or the manager hits this button confirm uh it sends back the email that your reservation have been confirmed uh and something like maybe successful yeah something of that sort and if the reservation uh is denied by the hotel maybe the the super admin or the manager can just uh click can't do it something of that sort so yeah that is what i have and the last thing i wanna explain from the menu yeah actually not the menu this last page I have here a certain form, a smaller form. So

Stephen Nyansoho (continued) 1:07:00

I place it here. So instead of forcing our clients to maybe log in or sign up, which sometimes kind of boring, maybe somebody is from maybe got to a link from maybe Instagram. So sometimes kind of boring, we are again asking for credentials. So if the client's happy with the Nini, with what he sees, he can just come here and subscribe for something like a newsletter subscriber so that if he provides an email here, So the marketing team will be able to send to send their marketing emails or anything of any update about sweet one. So, yes. So that is what I've been working on.

Global Solutions 1:09:57

Yeah, but yes.

Stephen Nyansoho 1:10:00

On the POS and on the website so that the website can be able to be connected directly to the POS. So what I'm really remaining with here is brushing on the front end and ensure that the UI is pretty top-notch. And also, I'm working on that recent emails because I was sent yesterday the API keys by people. So that is what I'm currently working on, yes, and that is what I have. So can I hear from you guys what to improve and, yeah, and questions? Thank you. Thank you very much.

Global Solutions 1:10:50

Yeah, think quite similar to some of the things that we spoke about with Kelvin's website. Just bear in mind that collection. I like the idea, of course, right now that when they're ordering, there's an option of, am I in the restaurant now or is it for collection for order? But what I know is that as a restaurant or the two restaurants, they don't allow, currently they don't allow somebody to place an order online. I like the fact that when they click on place an order online, it's encouraging them to use the QR code app. I think for now, I'd leave it in there just to showcase it as an idea to sweep one. Of course, they might turn around and say the exact same thing that I'm saying to you now. But I think it's more scope for something to integrate and think about later. Okay, okay, okay.

Stephen Nyansoho 1:11:53

Maybe is there anything to improve on the UI? Yeah, just on the visuals. There's a bit of... Text is being cut off.

Global Solutions 1:12:01

If you look on a lot of those pages, usually on the words like G, Y, you can see that the letters are being cut off by the images.

Stephen Nyansoho 1:12:12

Okay, okay, okay. If you can go back and I can show you exactly what I'm talking about. Okay, let me, let me just go back, let me just go back. So if we go to like, our story.

Global Solutions 1:12:25

Okay, let me go to our story. There I am. Our story hasn't got it. Go to the menu. I can't remember where I saw it. Yeah, so you see there, worth turning up for, you see the way the G's cut off. Yeah, yeah, yeah, I can see it. Yeah, so that happens on quite a few of the pages where there's like a G or a Y being used. So just make sure on that front that it's not cut off. Of course, currently the website in its state, if I come... Pairing the two websites, the first one, it definitely feels more like a suite one website. And of course, I can see you haven't integrated the logos. It's yet to have that suite one feel for me. So I think all the time when it is inclusive of the exact logos, the exact way that suite one present things, then naturally that should come into play. But currently, I'm not feeling it as much as I was feeling in the first one where I can feel that. All right, this is definitely a suite one, but that will come over time. Events-wise, I know they don't do many events on the first two restaurants, but they do. So in fact, having the feature there is still useful.

Stephen Nyansoho 1:13:45

I think it's sensible once again to have it there and see what they say when we speak to them.

Global Solutions 1:13:50

But then just going back to, I like the way how the website starts, where you've got, okay, coming up. But because they're not so events-based in these two restaurants... For me, I think a better idea might be something like use special promo code, or we have this new dish coming up, something a bit different that suits the need of the restaurants. I like the fact that it's very front facing, and it looks good. I've just got onto the website and you're telling me what's exclusive. So exclusive new recipe coming up, or use special new promo code or something like that, or sign up for new special discount or something like that, that comes up and it's in your face straight away. Yeah.

Stephen Nyansoho 1:14:30

I don't mind that.

Global Solutions 1:14:32

I think once again, what we will do, you see the way this website starts, you can't use the same exact video as Sweet One Live, but we have video footage on Chingford and Lewisham. Okay. What they will ask for is maybe one of those videos integrated in the same manner, because if you look at the modern day design of a lot of restaurants, they are going for that manner where there's a lot of dynamic visual. still may-11 The photos are great. In fact, this photo here, it doesn't look too bad. It actually fits. But I think what they would like to see similar to that sweet one, that video, you can see very much it belongs to sweet one, which was the point I was making. Okay. It might mean we have to turn around and say to sweet one, I think you guys need a bit more landscape footage, which is something that's already been discussed. But if you can, yeah, if we can think about that, see if there's anything to integrate. If there's not, then we'll think about it. Of course, what we don't want is the same video on both websites. But I think maybe as a short term solution, that might be the case to start off with until they shoot out any more video footage. Okay. The table reservations, once again, just take into account that they want the reservations to run through seven rooms. What I have done is I've contacted seven rooms about the custom API of what we want to be able to For me,

Global Solutions (continued) 1:14:32

my problem with what Seven Rooms currently looks like on their websites is it decreases the aesthetical design.

Stephen Nyansoho 1:16:08

just looks like something that's chunked there.

Global Solutions 1:16:10

So within my inquiry of us, is there any way in which you can give us custom control over that? But as a restaurant, they want to stick to the fact that their reservations, want it to run through Seven Rooms. If there's something smart where we're able to keep our aesthetic design, but those reservations still run through Seven Rooms, those are the things I would want us to think about. But I've begun the contact process with Seven Rooms to give us control around the custom APIs. Okay. The last thing I wanted to say is just around the recent emails, just making sure that each email has a bespoke, aesthetical branding design that fits those two restaurants. They shouldn't be generic or look like it's me messaging my friend.

Stephen Nyansoho 1:16:59

But similarly,

Global Solutions 1:17:00

in to what we saw at the end of the last presentation from Kelvin, that the emails need to have a way in which they look because this is our sweet one send out emails.

ACTION ITEM: Send venue walkthrough videos (Lewisham, Chingford) to Stephen; Stephen integrates Explore

Stephen Nyansoho 1:17:11

okay nice nice okay okay okay me i have an inquiry go for it uh okay uh i i really need maybe a walkthrough video maybe like uh maybe on locations here maybe in on locations here uh i can have something like uh maybe explore explore explore sweet one uh uh maybe uh explore sweet one so if somebody hit the explore then maybe it gives him uh the details uh uh the detail uh detailed uh features of that branch so maybe a walkthrough maybe showing how the hotel looks so i uh if i can get a video Maybe something of that sort, to show the walkthrough of a branch, I can really appreciate about that. No problem.

Global Solutions 1:18:09

No problem. Yeah, yeah, yeah.

Stephen Nyansoho 1:18:12

I think more other questions people asked, and I think I'm good.

Global Solutions 1:18:24

Got you. So that Explore, when you say Explore, is that like a visual video you're looking for? Yes, yes, yes, yes, yes, yes. Okay, and then like it will, it will walk somebody through the two different venues in essence. Yes, yes, yes, yes.

Stephen Nyansoho 1:18:46

Okay, so that's, that's an idea, huh? Yeah, that is the idea. So if maybe we have maybe Sweet One branch, maybe let's say downtown, we have maybe an Explore video for that downtown, and maybe if it's... uh maybe after we have something of that sort yeah yeah so that we can now we can give the client a clear visual yeah i'm with you i'm with you anything else no no no i'm good i think uh people asked many of the questions so i get the clarity okay anything else for that matter aha okay just uh clarification on the user interface i like uh i always like creating a mad thing okay okay making sure the ui is very interactive it's very good so that so that is not generic for that reason we we we are supposed to meet with steve

Kelvin Kibiru Peter 1:20:00

Tonight, and that should, we should, that should overhaul the whole design system. We should, by morning, we should be done with making sure the two sites are good in terms of the user interface, if it's the videos and all that.

ACTION ITEM: Host Sweet One Live on VPS; host workforce platform

Global Solutions 1:20:15

So we'll make sure that the sites are good with the user interface.

Kelvin Kibiru Peter 1:20:18

We are also going to host the live platform. We're going to host it on VPS tonight. And that's why I also wanted around \$16. I also want to host the workforce platforms, but I want us to do that tonight. We host, I host, I want to host the workforce platform. Well, Steve can work to host this platform. We do some tests and of course, by tomorrow, the user interface should be all done. And that's pretty much it.

ACTION ITEM: Send \$16 via M-Pesa to Kelvin

Stephen Nyansoho 1:20:51

All right. And that's it.

Kelvin Kibiru Peter 1:20:59

mean, yeah, no. All right. That's cool. I'll get the \$16 sent to you shortly.

Global Solutions 1:21:04

I'll do that as of right now. That's not a problem. I can send that to you via Mpeso. Is that fine? Yeah, that's okay. That's okay.

Kelvin Kibiru Peter 1:21:16

Yeah, I'll do that as of right.

Stephen Nyansoho 1:21:19

Is there anything else for that matter?

Kelvin Kibiru Peter 1:21:23

No, no. I just have one final question for you.

Stephen Nyansoho 1:21:28

What do you think? How's the progress so far?

Kelvin Kibiru Peter 1:21:32

What can you comment on that? I'm very impressed.

Global Solutions 1:21:37

I'm very impressed. I'm very impressed. I'm very impressed. I don't want to say too much because I like the direction of where things have gone.

Kelvin Kibiru Peter 1:21:46

We'll do what we need to do.

Global Solutions 1:21:48

And then I guess, look, the most important people that will tell us where the direction needs to go is sweet one themselves. As of what it's looking like right now, it's fitting my expectations. menu. mentioned I in I I And we just continue to build. I think what I quite like about or what I'm learning about the process of development, it's not set in store. So if there are things that need to be changed and shifted or added, we can do that. So we just continue to keep communicating and working towards the end objective. Okay, interesting.

Kelvin Kibiru Peter 1:22:24

But on a whole and on a piece, it's making sense to me.

Global Solutions 1:22:28

The dashboard functionality makes sense.

Stephen Nyansoho 1:22:30

The websites themselves, they look good and they'll look even better.

ACTION ITEM: Schedule Sweet One client meeting for Sep 3 12:00 KE / 10:00 UK

Global Solutions 1:22:34

So I know this isn't even the end state.

Stephen Nyansoho 1:22:37

So I'm excited to see what the end product looks like.

Global Solutions 1:22:43

Okay, okay. Then you will work to set up a meeting.

Kelvin Kibiru Peter 1:22:47

And on that, we did agree 12, did we agree 12? Yeah, you said 12, 10 a.m. outside. So 12 in the afternoon, Kenyan timing.

Global Solutions 1:22:58

Yeah.

Kelvin Kibiru Peter 1:22:59

10 a.m. here.

Global Solutions 1:23:00

on the third, first day the third yeah yeah yeah that's all agreed that's all agreed okay i'll put that in with them and i think we can then we can call it uh we can call it off for today no problem no problem thank you for meeting thank you for your efforts it's very much appreciated okay thank you too yeah take care have a good day you too
